Consanguinity: No Yes
Transplants (bone marrow, tissue, stem cells) ☐ No ☐ Yes, (please specify)
Inquiry
☑ Family Planning Panel (1943 Genes, FPP) including FMR1 Repeat and SMN1 MLPA
Both persons seeking advice will receive a joint report listing variants in genes that could lead to severe diseases in their offspring, if disease onset is expected to occur during childhood. Analysis of the FMR1 repeat is performed only in female probands.
Additional analysis (additional fees may apply)
□ ACMG genes diagnostics I would like to be informed of relevant alterations within the list of recommended genes for secondary analysis, according to the current guidelines of the American College of Medical Genetics and Genomics. The analysis is restricted to the sequence data, re-sequencing of regions with poor sequence coverage will not typically be performed. A negative "ACMG genes" report cannot be used to rule out (genetic) disease risk. Additional fees may apply. According to German legislation, predictive tests for minors may not be performed for diseases which have an onset in adulthood. Therefore, some genes will not be analyzed for minors, unless the phenotypic spectrum is within the scope of the primary medical indication of the patient. Details on genes and associated diseases can be found at https://www.cegat.com/acmg-genes/
□ Pharmacogenetics (PGX) (22 genes) ABCG2, CACNA1S, CYP2B6, CYP2C19, CYP2D6, CYP3A4, CYP3A5, CYP4F2, DPYD, G6PD, HLA-A, HLA-B, IFNL3, MT-RNR1, NUDT15, POR, RYR1, SLCO1B1, TPMT, UGT1A1, VKORC1

I would like to receive an additional report analyzing known variants that are involved in the metabolism of pharmaceutical products.

Disease-relevant changes (SNV/CNV) in the genes listed above will be reported (diseases underlying a recessive/X-chromosomal inheritance pattern). In addition, disease-causing alterations (SNV/CNV) may be reported in other genes known to be subject to genetic imprinting. Furthermore, it may be possible to report variants in other genes associated with dominantly inherited diseases if these are present as a genetic mosaic in one of the persons seeking advice. Only variants in genes are reported, which, within the framework of the respective underlying inheritance processes, can potentially lead to serious diseases in the planned offspring of the couple seeking advice, with an assumed onset of disease in childhood. Single variants of a parent, that might lead to the potential offspring being an inherited carrier without expected disease onset, are not reported. The findings are limited to variants of ACMG classes 4(LP)/5(P), that are confirmed to be disease-relevant according to current data. Individual ACMG class 3(VUS) variants may be additionally considered in individual cases at a physician's discretion.
